Quick Guide: Understanding & Navigating Child Meltdowns

A simple guide to why meltdowns happen and how calm adultts can help

1 The Brain State During a Meltdown

During a meltdown, a child's "downstairs brain" takes over. The emotional brain is in high alert, and the "upstairs brain" (thinking and reasoning) goes offline. This is a brain-based response, not a choice.

Downstairs Brain (Emotional Brain)
- Fight, flight or freeze
- Big emotions
- No access to logic

Upstairs Brain (Thinking Brain)
- Reasoning
- Problem solving
- Self-control
- Goes offline during a meltdown

2 Dysregulation vs. Misbehavior

Meltdowns are usually a sign of nervous system dysregulation, not intentional misbehavior.

DYSREGULATION
(What's Really Happening)

- Overwhelmed nervous system
- Big emotions feel uncontrollable
- Not able to use logic or listen
- Needs support, safety and co-regulation
- Happens to all children at times

MISBEHAVIOR
(What It's Not)

- Usually a choice
- Trying to get something
- Able to listen and understand
- Can be corrected with clear limits
- More intentional and goal-directed

3 Common Triggers

Meltdowns can be triggered by many everyday situations, especially when a child is tired, hungry, overstimulated or feeling big emotions.

Tiredness
Lack of sleep can lower frustration threshold.

Hunger
Low blood sugar can make emotions bigger.

Overstimulation
Too much noise, crowds or sensory input can overwhelm.

Transitions
Moving from one activity to another can be hard.

Big Emotions
Feelings like frustration, sadness or anxiety can build up.

Unmet Needs
Needing attention, connection, predictability or control.

4 4 Action Steps During a Meltdown

You can't stop a meltdown instantly, but these steps can help your child feel safer and regain calm more quickly.

1 Lower Your Voice and Body

- Speak slowly and softly.
- Get down to their level.
- Use a calm, relaxed posture.
- Regulate your own breathing.

2 Use Minimal Words

- Keep it short and simple.
- Avoid lectures or questions.
- Use a reassuring, warm tone.
- Let your calm presence do the work.

3 Ensure Safety First

- Move to a safe, quiet space.
- Remove potential dangers.
- Give them space if needed.
- Stay nearby to show you're there.

4 Reconnect After

- Wait until they are calm.
- Offer comfort and connection.
- Validate their feelings ("That was really hard").
- Talk about it later, if needed.

Key Takeaway: A calm adult is an external nervous system for a child.
